Sleep Health: Educational Reference Notes

Sleep is an important part of physical and mental wellbeing. Sleep needs vary by age and individual circumstances. Sleep hygiene refers to everyday habits and environmental conditions that support consistent, restful sleep. A regular sleep and wake schedule can help maintain the body's sleep-wake rhythm. A calm, comfortable, dark, and quiet sleeping environment may be helpful. A relaxing wind-down routine, regular daytime activity, and limiting late-day caffeine can support sleep for some people. Bright screens and stimulating activities close to bedtime may make it harder for some people to settle. Persistent sleep difficulties or daytime impairment should be discussed with a qualified health professional. Sleep advice is general information and is not a substitute for personal medical care.
